

**Table 2:** Mann Whitney U tests. Relationship between patients having ocular surface disease and OSDI, BUT and Schirmer values after the third chemotherapeutic cycle. Values presented are the median and the interquartile ranges (IQR).

	Patients with Ocular Surface Disease	Patients without Ocular Surface Disease	P
OSDI Median (IQR)	33.30 (12.50)	4.10 (2.60)	0.001
BUT Median (IQR)	8.00 (4.00)	12.00 (5.00)	0.005
Schirmer test Median (IQR)	18.00 (10.00)	18.00 (10.00)	0.572
N	34	27	

Patients with ocular surface disease have statistically significant different OSDI score and BUT values comparing to patients without ocular surface disease but patients with ocular surface disease have no statistically significant different Schirmer values comparing to patients without ocular surface disease.
