**Table 1:** Comparison of general data between the two groups with right-sided colon cancer. The study group underwent laparoscopic-assisted right hemicolectomy following intestinal decompression for acute intestinal obstruction, and the control without obstruction underwent laparoscopic right hemicolectomy.

	Gender		Age		Tumor location		
Group	М	F	<70	≥70	Ileocecal area	Ascending colon	Hepatic flexure of the colon
Study group (n =22)	10	12	13	9	10	8	4
Control group (n =36)	19	17	19	17	10	14	12
Chi-squared ( $\chi^2$ ) value	0.293		0.220			2.397	
p value	0.588		0.639			0.302	

Age is in years, M: male, F: female.
